

Hunt Comfort Introduces Advanced ComfortTEX Fabrics

Made in the USA using environmentally conscious products and processes, Hunt Comfort's New ComforTEX outdoor seating fabrics vastly improve seating comfort by giving into the cushion mechanics. This stretch property reduces harmful shear effects on the skin and makes long hunts more enjoyable, not to mention the fabrics boast vastly superior wear compared to imported fabrics.

Special knit construction provides a soft hand with low surface friction, which reduces contact noise making ComforTEX an ideal fabric for hunting. And, ComforTEX's technical back is laminated with a waterproof, breathable membrane, which is ideal for time in the field, no matter the weather.

New oil- and water-repellent DWR finish provides optimum performance and protection in the rain. With impressive resistance to water pressure and the highest requirements for abrasion- and wash-resistance, the new DWR technology is durable and long lasting.

Hunt Comfort recognizes the need to demonstrate environmental stewardship in all facets of its operations. The company is vigilant when selecting materials, technology and "green" processes, which are safe for both the employees' health and for the environment. All of Hunt Comfort's flexible foam products are manufactured at facilities holding CertiPUR US Certification to ensure that they do not contain harmful materials such as lead, mercury or PBDE fire retardants. All in-house adhesives are water-born and do not release harmful volatiles into the atmosphere. APEO free - no flammable solvents are used in the DWR application.

Fabrics come in new high definition print Mossy Oak® Breakup™ and Treestand™ camouflage patterns, as well as Coyote brown and Foliage green camouflage solids.
